# Session - 1

This session deals with

- Why Data Science

- About Data Science

- Definitions of Data Science

- What is machine Learning

- Where Machine Learning is used

- Types of Machine Learning

- Course Structure

Huge amount of data is generated from last 3 decades

Examples of data generators: Websites, Smart phones, Stock Markets

Lot of hidden information is in that data which no one can observe.

Analysis is required on data to find the hidden facts

Data might be in structured/semi-structured/unstructured form.

It is difficult to analyze the structured data with unstructured data

Analysis of Real-Time data is challenging task

Analysis of Big Data is challenging task

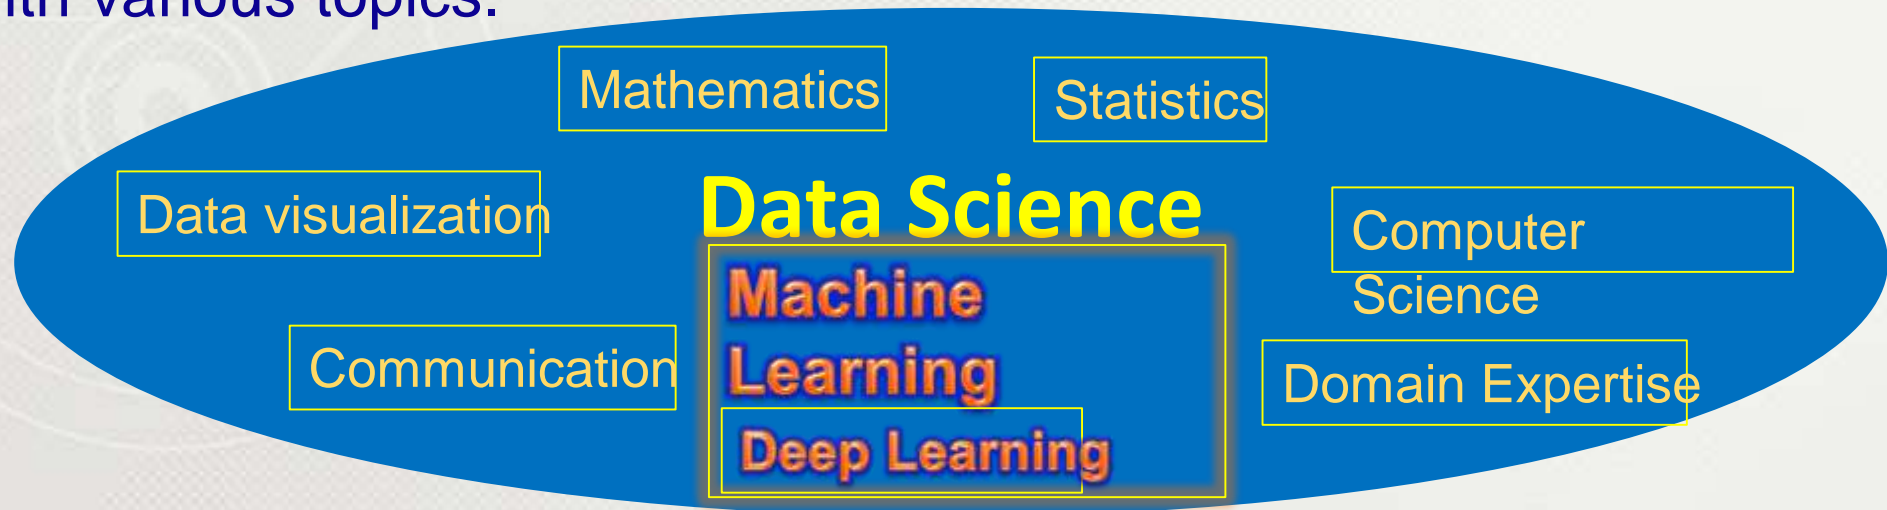

Companies like Facebook, Yahoo, Google, LinkedIn started to analyze data to improve their product.

Data Science is an emerging field with rapid changes and opportunities

It is linked with various topics.

The scope of data science is measureless

Manufacturing

Education

Healthcare

Sports & Games

Finance

Telecom

Many more....

Biotech

Transport & travel

## Sources of Data

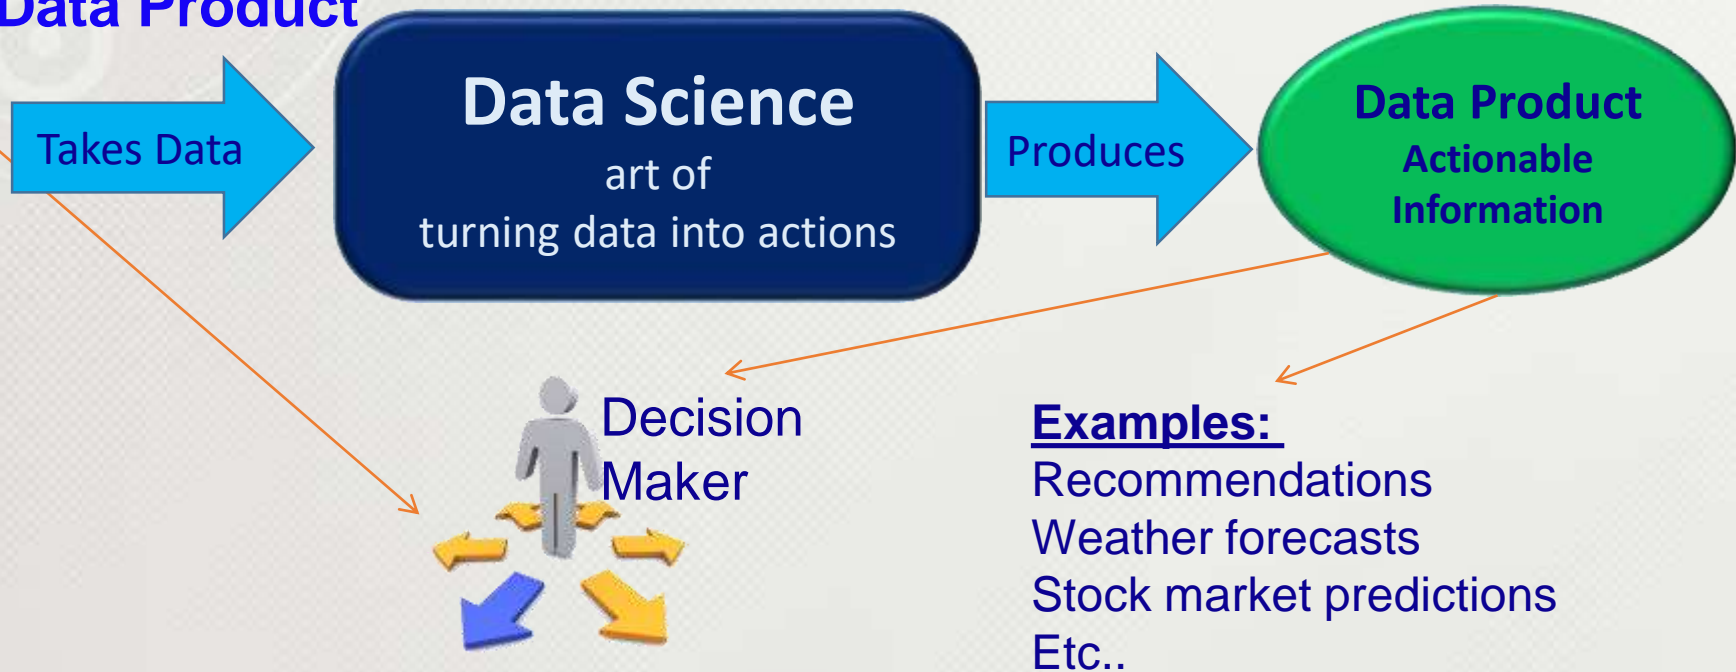

Streaming

[www.teleuniv.com](http://www.teleuniv.com)

Data is available from various sources.  
Data can be in various formats : structured/unstructured/semi-structured  
It might be useful or irrelevant for a particular purpose.

**Data science is an art of turning data into actions by producing Data Product**

# What Is Machine Learning...?

Machine Learning is the science (and art) of programming computers so they can learn from data.

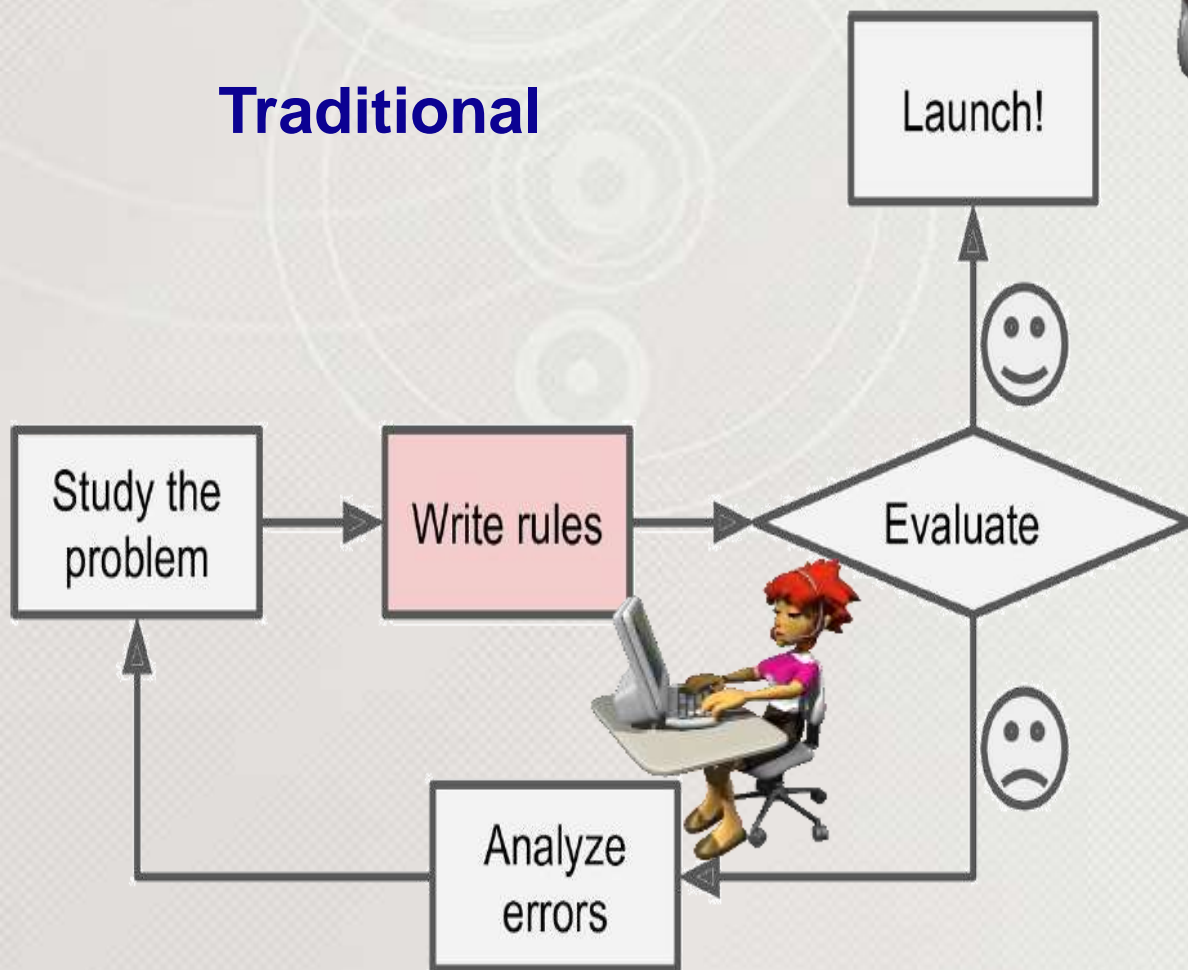

Machine Learning is the field of study that gives computers the ability to learn without being explicitly programmed.

A computer program is said to learn from experience  $E$  with respect to some task  $T$  and some performance measure  $P$ , if its performance on  $T$ , as measured by  $P$ , improves with experience  $E$ .

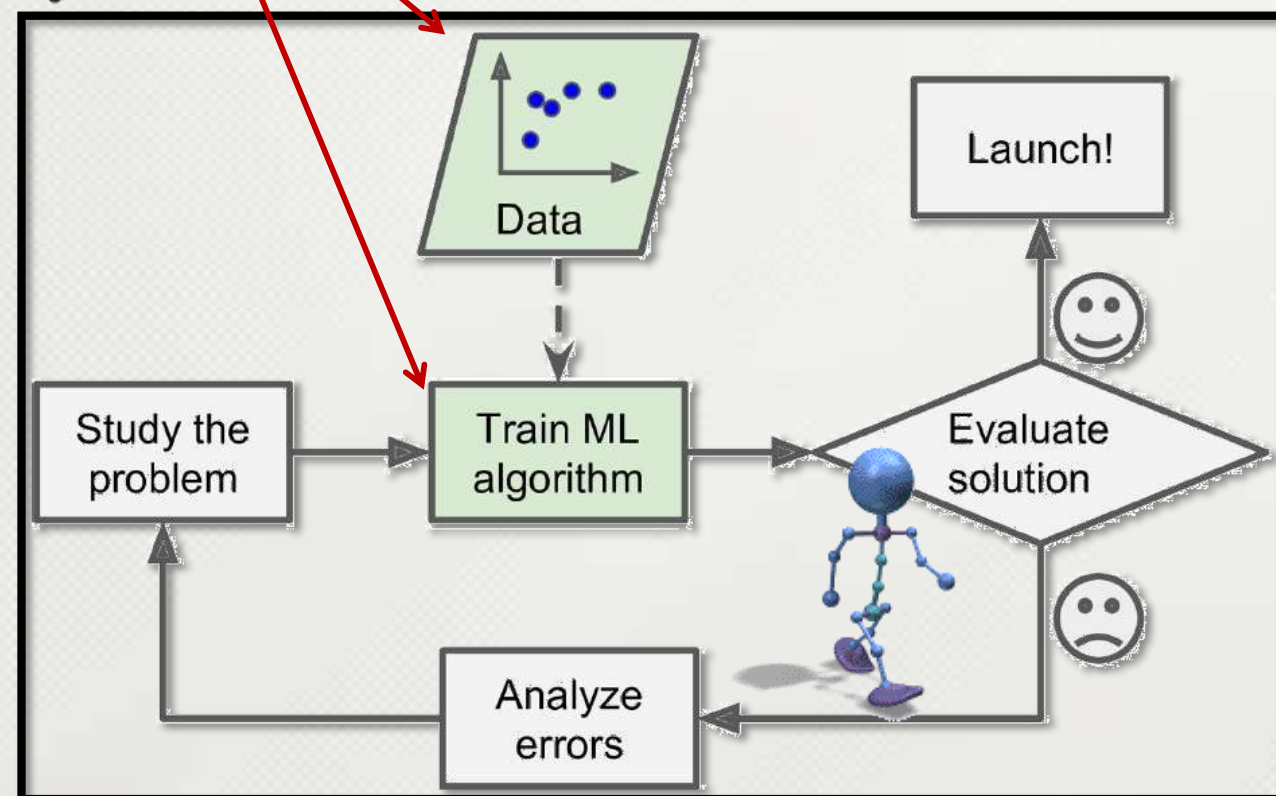

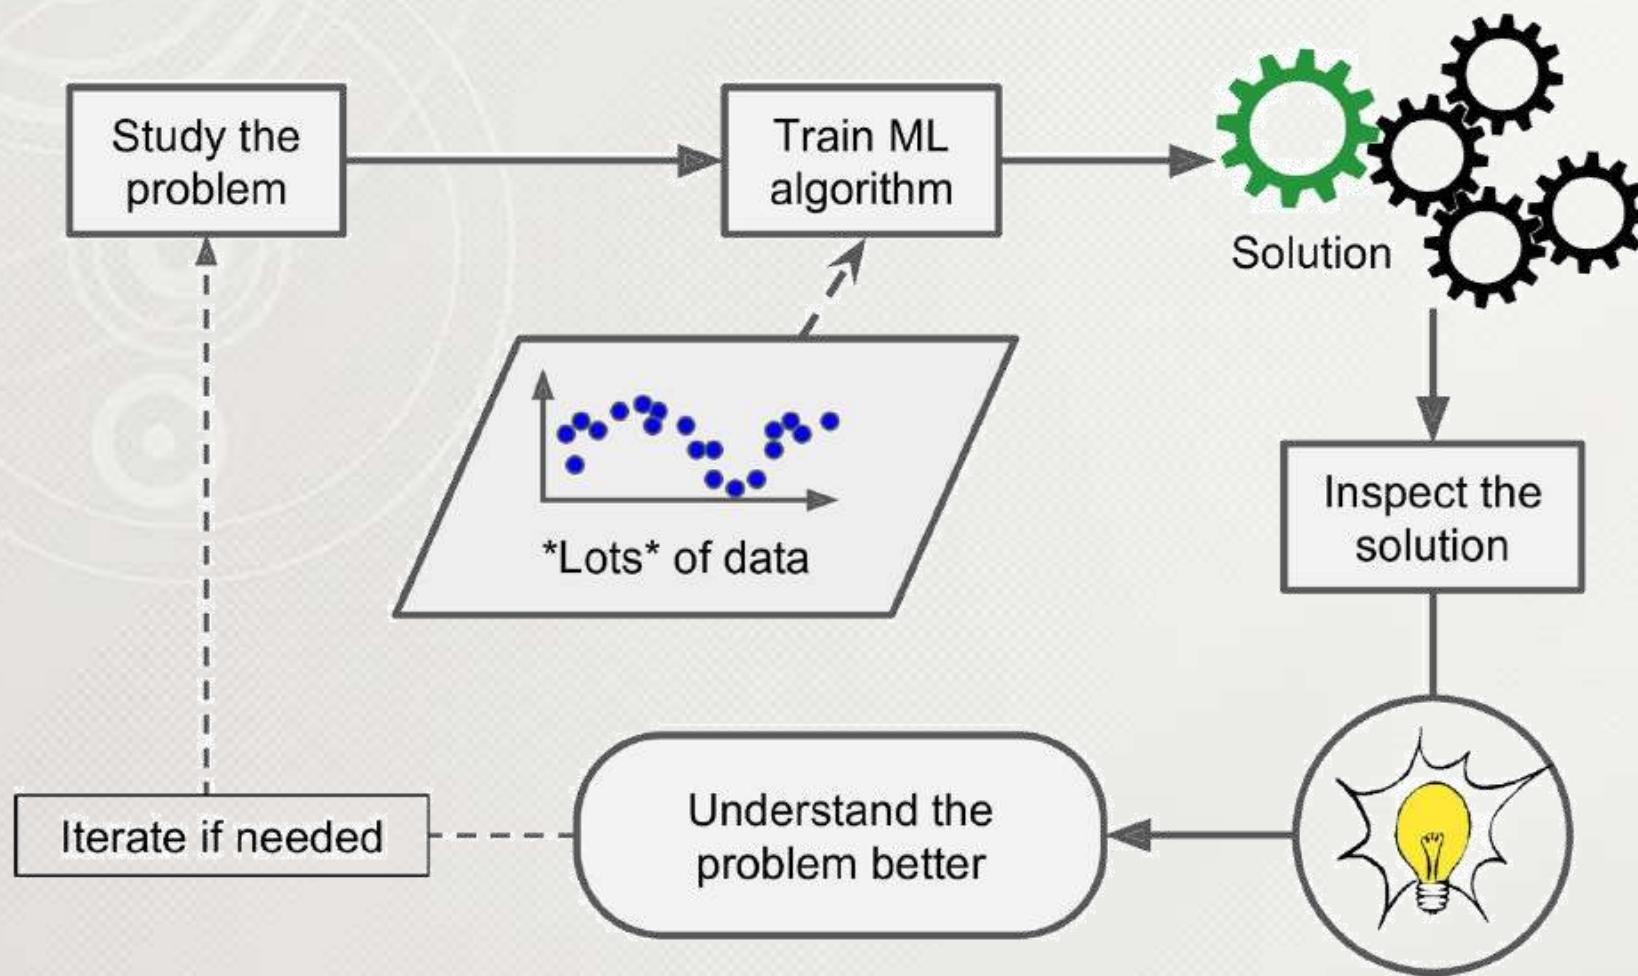

**Traditional**

**Machine Learning**

## Where ML fit for...?

- Problems for which existing solutions require a lot of hand-tuning or long lists of rules: one Machine Learning algorithm can often simplify code and perform better.
- Complex problems for which there is no good solution at all using a traditional approach: the best Machine Learning techniques can find a solution.
- Fluctuating environments: a Machine Learning system can adapt to new data.
- Getting insights about complex problems and large amounts of data.

Training set

### Classification

- k-Nearest Neighbors
- Linear Regression
- Logistic Regression
- Support Vector Machines (SVMs)
- Decision Trees and Random Forests
- Neural networks<sup>2</sup>

### Regression

Class	Percentage
10 <sup>th</sup>	62
Intermediate	78
Graduation	X
PG	85

Class	Percentage
Graduation	82

Training set

Figure 1-7. An unlabeled training set for unsupervised learning

Figure 1-8. Clustering

- Clustering
  - k-Means
  - Hierarchical Cluster Analysis (HCA)
  - Expectation Maximization
- Visualization and dimensionality reduction
  - Principal Component Analysis (PCA)
  - Kernel PCA
  - Locally-Linear Embedding (LLE)
  - t-distributed Stochastic Neighbor Embedding (t-SNE)
- Association rule learning
  - Apriori
  - Eclat

IDE

**BASICS OF PYTHON**

**NumPy**

**Data Analysis**

**Pandas**

**Python Data Structures**

**DATA  
VISUALIZATION**

**Data Science  
Case Studies**

**MATPLOTLIB**

Data Visualization in Python

**Seaborn**

  
**ANACONDA**

# Session - 1

## Conclusion

You are aware of

- What is Data Science

- What is Machine Learning

- Types of Machine Learning

We will proceed with

- Python

**THANK  
YOU**
